

Synergy

REPLICATOR

for OpenText Content Server

Everyone needs quick access to content they

require. **Synergy Replicator** reflects the way people work, the way organizations function, and the way they allocate infrastructure resources in the most intelligent and cost effective manner. Groups within organizations have different needs for content and **Replicator** provides greater performance by storing documents locally for those who need them.

Synergy has a history of implementing replication solutions to assist with the complex business of securing, accessing and managing vast amounts of information in a global network. We have evolved our award winning LiveSync module with the scope and understanding from custom implementations for peer to peer failover modules, into the **Replicator** product which utilizes the latest features of the platform.

Take Content Server one step further with

Replicator by intelligently distributing information in such a way that users on the global network have faster access to the most up-to-date version of documents. **Replicator** works in low bandwidth environments and reduces network traffic, lowering overall infrastructure cost.

Replicator is a great tool for migrations, upgrades, consolidations and separation of Livelink instances.

With support for most OpenText Content Server object types including workflows and classifications, **Replicator** is the perfect tool to use for migrating or consolidating data from one instance of Content Server to another. It can be used to split an existing instance into multiple systems. It can also be used to consolidate complete or partial instances into a single instance. Finally, the **Replicator** can be used to perform upgrades to Content Server, which can be especially beneficial when moving to new hardware environments and versions of Content Server.

INTELLIGENTLY DISTRIBUTE INFORMATION WITH REPLICATOR FOR FASTER ACCESS TO NEEDED DOCUMENTS

Key Features

- Replicate specific folders/documents or the entire system
- Create read-only replicas
- Compressed payload transfers to minimize network traffic
- Avoid a single point of catastrophic failure
- Hot-backup of the entire contents of a production server for failover
- For partner access, physically separate secure partitioning of selected Content Server information
- Simplified approach to upgrades involving multiple version levels of Content Server
- Supports all base Content Server functions, modules and customizations
- Push common folders and documents to regional Content Server servers
- Simple installation as a Content Server module
- No additional hardware required

Synergy Replicator for OpenText Content Server

Benefits

Active Updates

Synergy's Replicator provides a full multi-directional replication capability. Content Server objects are replicated to one or more participating systems. Any modifications to any of those replicas will be reflected back to every other replica as well as the original object. All sites in production are updated automatically using a proprietary technology that enables transmission of data over low bandwidth networks.

Universal Access

Allows multiple systems to present a custom federated enterprise view to different users and organizations.

Disaster Recovery

Can be used to solve Content Server specific issues when designing hot backup and failover solutions for various Content Server environments.
