**ACROSS** geographic barriers

Synergy  
**REPLICATOR**  
for SharePoint

**BI-DIRECTIONAL REPLICATION  
CHECK-IN/CHECK-OUT  
AND KEEP DOCUMENT  
LIBRARIES IN SYNC**

## Everyone needs quick access to content they require.

Without quick access to content your organization wastes productivity, risks costly errors, and miscommunication. Synergy Replicator offers a solution by reflecting the way people work, the way organizations function, and the way they allocate infrastructure resources in the most intelligent and cost effective manner. Groups within organizations have different needs for content. Replicator provides greater performance by storing documents and metadata locally for the people who need them.

## Reduce network bandwidth requirements and lower infrastructure costs

with Synergy Replicator for SharePoint. This is done by distributing information in such a way that users on a global network have faster access to the most up-to-date version of documents.

## Replicator is Flexible to support both HTTP or HTTPS.

Synergy Replicator supports replicating ancestor paths or re-parenting sites under different taxonomies. You can replicate content from one site to another site or to a portal area.

## Synergy has a history of implementing replication solutions

to assist with the complex business of securing, accessing and managing large amounts of information in a global network. Synergy Replicator has evolved from experience implementing replication and failover solutions in disparate environments around the world. Furthermore, we have a vast experience of working with customers small and large, and understanding their infrastructure and replication needs.

## Benefits

### Active Updates

Synergy Replicator provides a full multi-directional replication capability. SharePoint™ objects are replicated to one or more participating systems. Any modifications to any of those replicas will be reflected back to every other replica as well as the original object. All sites are updated automatically using the standard HTTP/HTTPS protocol and data compression that enables operation through firewalls and minimizes network bandwidth requirements.

### Universal Access

Allows multiple systems to present a custom federated enterprise view to different users and organizations.

### Ease of Operation

No client software, no caching technology. Integrated into SharePoint's administrative menus. SharePoint™ to SharePoint™ on a schedule that you determine.

## Keep information current ACROSS geographic barriers

### Key Features

- Integrated into SharePoint - no additional training for external applications
- Synergy Differential Compression - faster and more efficient replication by only transferring the blocks that change, not the whole file
- Keep user and group information synchronized between sites
- Replicate permissions assigned on the list
- Rules engine to selectively replicate based on meta-data, content type, or list
- Supports replication of check-in/check-out state and all meta-data, including content types and site columns
- Conflict resolution support
- Map library to an alternate named site
- HTTP/HTTPS protocols only, requiring no infrastructure changes
- No crawlers that put a load on the server, replication is event-based or on demand
