

# Presentation Publisher

**Optional Add-on for Replicator.** Provides the ability to replicate the look and feel elements to remote servers.

**Visual Elements Replicated.** Many environments allow each of the remote SharePoint servers to have a different branding. By default, when the layout and look and feel changes, replicator does not ship any of these items to any remote servers. Presentation Publisher adds the ability to have these elements replicated to remote servers where there is a need for the presentation, look and feel to be the same.

**Selective Replication.** Utilizing Replicator, the various presentation elements can be added as an event for replication. Views, themes and site settings can be individually selected for replication at the push of a button. The layout of web parts and the applicable settings are also available to be queued for replication.

## Benefits

### Look and Feel Elements Replicated

Users that are given control over the web part layout will have their changes replicated to other participating servers.

### Automatic Operations

No need to have central administration rights. A user that has the permission to edit the look and feel will have their changes captured and replicated automatically to the remote sites.

### Benefits of Replicator

Presentation Publisher utilizes the same configuration and transport as Synergy's award winning Replicator product. This provides the efficient network transport and guaranteed delivery of any changes.

## Key Features

- Integrated into SharePoint user interface
- Replicates views, navigation elements, site settings, themes and web part layouts.
- Enhances the tools page of Replicator
- Provides additional queuing options for pushing existing data to remote servers
- Utilizes replicator infrastructure for network challenged environments

## Specification

**Replicator:** Synergy Replicator 2.6 is required to be installed and configured
